

Cellulitis

Cellulitis is an acute infection of the skin involving the dermis and subcutaneous tissues. It usually presents as a diffuse, spreading area of skin erythema, commonly involving the lower limbs. Cellulitis is a very common presentation to general practice. GP registrars need to have a systematic approach to assessment and management of this condition.

Cellulitis

Clinical Reasoning Challenge

Jimmy Conti, aged 76, presents to you with a hot, painful, red right leg for the past 36 hours. He has never had anything like this before. Jimmy has no features that would make him high risk. Your examination reveals redness and swelling of the lower leg to mid-calf, but no signs of sepsis. You make a provisional diagnosis of cellulitis.

QUESTION 1. You suspect cellulitis. What are the key features on history to stratify his risk of more serious disease or complications? List as many as appropriate.

QUESTION 2. What investigations would you request at this stage to confirm your diagnosis? List as many as appropriate.

QUESTION 3. What are the key aspects of management of Jimmy at this stage? List as many as appropriate.

Cellulitis

ANSWERS

QUESTION 1

You suspect cellulitis. What are the key features on history to stratify his risk of more serious disease or complications? List as many as appropriate.

- Severe pain
- Fever
- Rapid progression
- History of chronic disease e.g. diabetes
- Immunosuppression
- Heavy alcohol use
- Animal bite or marine exposure
- Obesity

QUESTION 2

What investigations would you request at this stage to confirm your diagnosis? List as many as appropriate.

- The diagnosis of cellulitis is primarily based on clinical features and uncomplicated cellulitis, as in this case, usually does not require investigations.

QUESTION 3

What are the key aspects of management of Jimmy at this stage? List as many as appropriate.

- Appropriate antibiotic management – see therapeutic guidelines
- Rest and elevation of the limb
- Follow up and safety netting
- Advice that the redness commonly gets worse for 48 hrs before starting to resolve
